UTILITY PATENT APPLICATION TRANSMITTAL

(Only for new nonprovisional applications under 37 CFR 1.53(b))

Attorney Docket No.	A-004
First Inventor	Fadel, Tarek
Title	Methods and Apparatus for Implementing ...
Express Mail Label No.	EK671162570US

APPLICATION ELEMENTS

See MPEP chapter 600 concerning utility patent application contents.

ADDRESS TO: Assistant Commissioner for Patents
Box Patent Application
Washington, DC 20231

1. ☑ Fee Transmittal Form (e.g., PTO/SB/17)
   (Submit an original and a duplicate for fee processing)
2. ☐ Applicant claims small entity status. See 37 CFR 1.27.
3. ☑ Specification [Total Pages ☐19]
   (preferred arrangement set forth below)
   - Descriptive title of the invention
   - Cross Reference to Related Applications
   - Statement Regarding Fed sponsored R & D
   - Reference to sequence listing, a table, or a computer program listing appendix
   - Background of the Invention
   - Brief Summary of the Invention
   - Brief Description of the Drawings *(if filed)*
   - Detailed Description
   - Claim(s)
   - Abstract of the Disclosure
4. ☑ Drawing(s) *(35 U.S.C. 113)* [Total Sheets ☐1]
5. Oath or Declaration [Total Pages ☐3]
   a. ☑ Newly executed (original or copy)
   b. ☐ Copy from a prior application (37 CFR 1.63 (d)) *(for continuation/divisional with Box 17 completed)*
      i. ☐ **DELETION OF INVENTOR(S)** Signed statement attached deleting inventor(s) named in the prior application, see 37 CFR 1 63(d)(2) and 1 33(b).
6. ☑ Application Data Sheet. See 37 CFR 1.76

7. ☐ CD-ROM or CD-R in duplicate, large table or Computer Program (*Appendix*)
8. Nucleotide and/or Amino Acid Sequence Submission *(if applicable, all necessary)*
   a. ☐ Computer Readable Form (CRF)
   b. Specification Sequence Listing on:
      i. ☐ CD-ROM or CD-R (2 copies); or
      ii. ☐ paper
   c. ☐ Statements verifying identity of above copies

ACCOMPANYING APPLICATION PARTS

9. ☐ Assignment Papers (cover sheet & document(s))
10. ☐ 37 CFR 3.73(b) Statement *(when there is an assignee)* ☐ Power of Attorney
11. ☐ English Translation Document *(if applicable)*
12. ☐ Information Disclosure Statement (IDS)/PTO-1449 ☐ Copies of IDS Citations
13. ☐ Preliminary Amendment
14. ☐ Return Receipt Postcard (MPEP 503) *(Should be specifically itemized)*
15. ☐ Certified Copy of Priority Document(s) *(if foreign priority is claimed)*
16. ☑ Other: ...Computer Program Appendix...
    ········On·paper··299 pages········

17. If a CONTINUING APPLICATION, *check appropriate box, and supply the requisite information below and in a preliminary amendment, or in an Application Data Sheet under 37 CFR 1.76:*
☐ Continuation ☐ Divisional ☐ Continuation-in-part (CIP) of prior application No.·_____/_____

Prior application information. Examiner_____ Group / Art Unit·_____

For CONTINUATION OR DIVISIONAL APPS only: The entire disclosure of the prior application, from which an oath or declaration is supplied under Box 5b, is considered a part of the disclosure of the accompanying continuation or divisional application and is hereby incorporated by reference. The incorporation can only be relied upon when a portion has been inadvertently omitted application parts.

18. CORRESPONDENCE ADDRESS

Field of the Invention

This invention relates to methods and apparatus for enabling online merchants to sell complex products and services using an integrated mechanism for personalizing sales, managing content and advertising, and generating reports.

Reference to Appendix and Copyright Statement

An appendix consisting of 299 pages accompanies and forms a part of this specification and contains Unix operating system script file listings and related data that illustrate a working illustrative embodiment of selected components of the invention. A portion of the disclosure of this patent document contains material that is subject to copyright protection. The copyright owner has no objection to the facsimile reproduction by anyone of the patent document or the patent disclosure, as it appears in the Patent and Trademark Office patent file or records, but otherwise reserves all copyright rights whatsoever.

Background of the Invention

The online sales market and its underlying technologies are quickly maturing. With the rapid market maturation, what were once competitive advantages are becoming commonplace. For example, most online consumers now expect competitive pricing, shopping carts, advance search capabilities, online status checking, email notifications, and more. These trends set lofty goals for companies who must develop more compelling online experiences, determine more ways to drive sales, and enhance their competitive advantages. Whether the intent is to sell complex or custom products over the Internet, to conduct one-on-one marketing, to understand the behavior and patterns of customers, to manage the ever-changing web store contents, or to enhance the ease of shopping, online companies must implement advanced techniques if they are to effectively compete

The ever increasing level of competition necessitates the infusion of best practices from sales and marketing with compelling product offerings. Product Managers must be able to maintain and build complex selling models without the traditional reliance on skilled programmers. Moreover, e-commerce applications need to be rapidly deployed and must be easily maintainable, even for complex & custom products.

In order to create distinct competitive advantages, companies must integrate sales and services. To improve customer attraction and retention, companies must develop and manage customer relationship via better sales and service integration and new technology. To insure that buyers to find what they need and place an order, the online selling process must be provide timely & accurate enterprise data, be structured in a way that is easy to use for the buyer, allow the buyer to find what they need without undue effort and frustration, and suggest products and services that are in the best interest of the customer.

Summary of the Invention

The present invention takes the form of a rapidly deployable, integrated online sales system which comprises a core storefront application that executes on a conventional web database server, guided buying and sales configuration capabilities for selling complex custom products and services, content management functions, a recommendation system for predicting the preferences of individual customers and making specific real-time recommendations during a shopping session, an advertising management system, a profiling system for customizing customer interactions based on the site visitor's demonstrated interests, and a reporting system that provides accurate and reliable analysis of user' behavior to create the valuable reports.

As contemplated by the invention, the core storefront database server system, the advertising management engine, the recommendation engine, the content manager, and the analysis report generator take the form of separate modules that can be rapidly integrated and deployed using pre-written installation and configuration scripts. The various components of the desired system are preferably first assembled as a pre-integrated prototype system that can be rapidly recreated, thereby seamlessly integrating the core storefront component with the other functional units. As the pre-written scripts execute during the deployment process, the installer is prompted to provide data values which are used to modify the content of pre-written configuration template files to accommodate the special needs of each individual installation. This rapid deployment methodology ensures a repeatable solution that allows businesses to quickly build and deploy e-commerce sites complete with guided buying and configuration capabilities.

In accordance with another feature of the invention, a web-based user interface provides centralized system administration functions. The administration system provides password protected log-in so that only authorized persons can perform the supported administration functions which include content management, content workflow, user management, product management, the creation of advertising programs, and the design and invocation of analytical reporting functions.

These and other objects, features and advantages of the present invention may be better understood through a consideration of the following detailed description in which frequent reference is made to the accompanying drawings.

Brief Description of the Drawings

Fig. 1 is a block diagram illustrating the relationship between the application modules that together form the integrated online sales system contemplated by the invention, and

Fig. 2 is a flow diagram illustrating the method used to rapidly deploy the integrated application to a target installation using pre-written operating system script files.

Detailed Description

The preferred embodiment of the invention takes the form of a fully integrated online sales system which can be used by companies that sell simple to complex products and services and which employ personalization, content management, ad management, and report generation.

The core of the system is provided by an online storefront seen at 101 in Fig. 1 which is preferably implement using iStore, a storefront application available from Oracle Corporation, Redwood Shores, CA, which employs the Oracle 8 relational database management system and Oracle application server. In addition, the storefront 101 preferably employs Oracle's Selling Point Internet Edition to add the guided buying and sales configuration capabilities need to sell complex products and services.

The storefront 101 is integrated with a content manager103 such as the Vignette Story Server available from Vignette Corporation, Austin, TX. The storefront 103 is further integrated with a recommendation engine 105 such NetPerceptions, available from Net Perceptions, Inc. of Eden Prairie, MN, an application which provides buying recommendations to site visitors based on a prediction of each visitor's preferences. NetPerceptions is integrated with iStore by means of a pre-written Java interface called iMarketing provided by Oracle.

The system further integrates advertising management functions as indicated at 107 which are preferably performed by AdManager that delivers targeted advertising and by ProfileServer, which provides customized advertising presentations based on a visitors demonstrated interests while preserving visitor anonymity. Both AdManager and ProfileServer are available from Engage, Inc.

of Raleigh, NC. Finally, Log files that record visitor activity are passed to an analysis and reporting module 109 which may be implemented by the NetAnalysis program from NetGenesis Corp. of Cambridge, MA. Each of these functional units is managed by the administration module 111. Module 111 provides a Web based menu interface to permit store employs to more easily manage the system.

The additional components integrated with the storefront applications enhance the capabilities of those applications by providing implicit and explicit personalization. Implicit personalization is achieved by observing the click-stream of the user and serving up relevant content on the store pages. Explicit personalization is achieved by asking the user to explicitly rate preferences and tastes, such as hobbies, age etc. and then using these to serve up relevant content.

In order to rapidly deploy such a comprehensive e-commerce solution, the present invention makes use of a pre-integrated prototype that is used to deploy all of the underlying components required to seamlessly integrate the various components of the system. The storefront applications 101, the recommendation engine 105, , the content manager 107, the advertising manager 109, the analysis and reporting module 109, and the administration menu system 111 are first individually loaded, configured and tested on a source computer to form an operational prototype. A like system is then be installed on one or more target machines by executing operating system script files which automatically load and initially configure the separately purchased application programs which make up system. By combining these preferred components in a rapidly deployable prototype, an easily repeatable integrated solution is provided to businesses, enabling them to quickly build e-commerce sites complete with guided buying and configuration capabilities.

Storefront 101

The core storefront 101 is preferably implemented by Oracle iStore 3.1, an application designed to enable businesses to sell non-configurable products and services over the Internet. Oracle iStore is a packaged e-commerce application that provides businesses with the necessary components to create Internet store sites for selling products and services in a secure and personalized environment. iStore supports multiple payment systems, allows the store operator to manage affiliate web links, and provides customers with coupons, discounts, and special promotions. iStore operates on the underlying technology platform of provided by the Oracle 8 relational database management system and Oracle Application Server. The iStore application can be readily integrated with back-office applications such as order entry, accounts receivable, and inventory, as well as with tax and shipping systems. Using iStore and its integrated back-office applications, customers may check inventory, place orders, and follow their orders through to delivery, all through the browser interface provided by the storefront 101.

The functionality of the storefront 101 can be further enhanced by adding the guided buying and sales configuration capabilities required to sell complex and custom products and services over the Internet. Oracle SellingPoint Internet Edition delivers these capabilities in the form of a customizable DHTML (Dynamic HyperText Markup Language) window that can be integrated into iStore. The Oracle SellingPoint adds guided buying, configuration and streamlined order submission to the core capabilities of iStore.

Content Manager 103

The Vignette StoryServer application may be advantageously integrated with the storefront to provide content management functions: this application provides a content management,

Page 7 of 20

personalization, decision support, and enterprise integration services to efficiently create shopping experiences that attract, engage, and retain customers. The content manager 103 simplifies the tasks performed by content authors, business users, and application developers.

Recommendation Engine 105

The recommendation engine 105 is a further application that is integrated with the storefront 105 to predict an individual shopper's preferences and make specific real-time buying recommendations during a shopping session. The recommendation engine determines each individual's preferences by observing that individual's behavior. It monitors such as click-through; analyzes past behavior; and obtains responses to queries, such as asking a shopper to rate a number of relevant items. Pooling this information with knowledge gained from a community of other individuals, the engine can makes buying recommendations with high predictive accuracy. The prototype system preferably employs the Oracle iMarketing application to provide personalized recommendations to the users, such as displaying the best selling items in the store, displaying popular items in each store section, displaying similar items bought by other users based on the items the current user has placed in his or her shopping cart.

Advertising Manager 107

The advertising manager application which forms part of the prototype system enables the site to deliver targeted advertising. The advertising manager functions are preferably performed by the AdManager and ProfileServer applications. AdManager presents automatically presents different advertising content in different sections of the store the user is browsing and works with ProfileServer which develops user profiles in real time so that the advertising which is presented to

the user is customized based on visitor's demonstrated interests while preserving the anonymity and privacy of the visitor.

Analysis and Reporting Module 109

5   During each shopping session, the prototype captures the user's behavior in log files indicated at 111 in Fig. 1. The log files 113 are then processed by the analysis and reporting module 109 to analyze the behavior of the site visitors and to provide useful management reports that can be used to provide the insight needed to improve the site's performance. The preferred prototype system integrate the functions provided b the Net Genesis NetAnalysis application to provide the desired

10   analysis and reporting functions.

The Administration Menu System 111

      The Administration Menu System 111 is a web based user interface that provides store employees with additional store management functionality to complement the basic management functionality provided by iStore, and to provide a unified mechanism for managing the other

15   applications that are integrated with the storefront 101 to form the prototype systems.

      The administration menu is password protected so that only authorized users can access its functions. As used here, the term Auser@ refers to employees, supervisors and administrators for a particular store which employs the combined functionality provided by the prototyped system. The

20   user initially accesses the administration store system by entering a specific URL which then prompts the user to enter the correct user name and password. If the user name and password is valid, the user will see an "Admin Menu" screen which displays links to the following options (1) manage content, (2) manage users, or (3) manage products. This page can serve as the home Page for all

administrative functions on the store. It provides links to all the third party products as well as to the iStore Store Manager page.

Content management functions allow users to create new product reviews or articles. The content can be optionally associated with a URL, an image and one or more keywords. The keywords are used to classify content and personalize it to consumers based on their preferences. After the content is entered, the user can click on a "start" button which will save the data to the database and begin a workflow process to obtain necessary approvals, etc as described below. Content previously saved can be located by performing a search for the title or part of the title. Once located, the user can select the content specified by the title for viewing and editing.

When content is created or edited, it goes through a pre-defined workflow. The workflow steps are:

(1) a given content item is created, or existing content is edited.

(2) the content item is displayed on a store supervisor or administrator's tasklist which is divided into two portions: the top portion consists of a status list of all the content currently in the system and the bottom portion consists of a list of all content currently in workflow. The status list specifies the title of the content, its type, its status in the workflow process (ready to launch, live or expired, and potential actions that can be taken with respect to the item (launch content, change status to live or expired, etc.).

(3) The Store Supervisor/Administrator will click on "Edit" under the Edit column to review the content, make any necessary changes, and save the content.

(4) The Store Supervisor/Administrator will click on "Finish" under the Action column.

(5) The Store Administrator will click on "Launch" under the Action column.

(6) The Store Administrator may click on "Expire" under the Action column to remove the content from the live site. Note: Store products are not be subject to the workflow.

The Amanage users@ option on the main administrative menu permits the user to perform a search of a specific user. When the search results are displayed, the person managing users can the click on the user of interest to bring up the user description page. This page includes means for changing the password for the selected user.

The administrative menu system 111 provides product management tools. The Find Product function in the Administration Menu uses iStore's PowerSearch functionality to allow a Store Employee/Supervisor/Administrator find a product from the iStore tables. Results will be displayed in a window below the search fields and the user can double-click a product in order to edit its information. A Retrieve/Edit/Submit Product Information option reveals a screen that allows attributes of the product (retrieved from the step above) to be changed by Store Employees, Supervisors, and Administrators. The attributes that can be changed include product name, label, description, image and manufacturer.

The manage accounts option on the administrative menu permits the user to search for particular accounts. Search results will be returned in a window and the Employee / Supervisor / Administrator can scroll through a list of matching accounts and double-click on the one they want to manage. Double clicking on an account opens a new window where the user will be able to enter a new password and must type the same password in a "Verify Password" field. If the passwords match it will be changed to the new password.

20   A link in the manage accounts screen takes the user to the AdManager application that allows the user to create AdCampaigns. Based on the criteria set in these ad campaigns, the AdManager will randomly serve these ads on the Store pages.

A further link takes the user to NetAnalysis reporting that allows the user to choose the types of reports that need to be generated and run them on the Store log files.

An additional link takes the Store Administrator/ Supervisor to the iStore Manager page provided by iStore for regular store management.

5

Deploying the Prototype

As noted earlier, the rapid deployment and initialization of a complete system which combines the functionality provided by the several integrated applications is achieved through the use of operating system script files which automatically installs the various packaged software products, as

10   purchased from each software vendor.

Performance improvements may be made by utilizing a middle tier approach in which the database functions are handled on one server and one or more application servers are used for the various integrated applications. When this approach is used, a separate installation is performed for each application. Note that the Oracle Application Server and Vignette require the presence of the

15   Apache Web server which means these combinations must be installed and kept together on whatever server is chosen. An installation could potentially have separate application servers for iStore and Vignette.

While there are a number of files that make up the set of scripts required to clone the prototype system on the source machine, the actual number of files which must be executed by the system

20   administrator to install a new iPrototype Storefront consists only of one file: setup.sh. The setup.sh script will prompt the user for all the necessary information to complete the installation using the cloning scripts. It is assumed that user has first performed the proper pre-installation tasks and is

familiar with the process before setup.sh is executed to call the proper scripts based on the answers provided to prompts.

Part IV of the Appendix contains a full list of all the Required Setup Information prompted by the setup.sh script. A first time install can usually use the default values that have been supplied. Part V of the Appendix contains an explanation of the supporting shell scripts and other files which comprise the cloning scripts and may be called by the setup.sh script, or by a script which was called by that script. It is not necessary to fully understand exactly how the cloning scripts work, but this is explained here for the interested user.

There are three main reasons for using the automated Acloning method of installation contemplated by the present invention, rather than using the standard installation procedure for the each of the products which comprise the iPrototype Storefront: to perform the installation more rapidly, to improve consistency, and to automate the integration of the various application program which form the online sales system.

There is a significant time savings with this method as opposed to performing a standard install for each product. As described above, there are several different products which comprise the iPrototype Storefront. The total installation time for all of them using conventional procedures would typically be measured in hours or more likely days when they are separately installed. In contrast, installation time for all products using the cloning approach can be measured in minutes on most machines.

In addition to the time saving of cloning versus a standard install for each product, the installer also saves a more substantial amount of time integrating the products. The files used in the cloning process are based on a working iPrototype Storefront. All products have already been integrated and are working together. This is a substantial time savings measured in days or more likely even in

weeks. Finally, after running the cloning scripts, the installer is assured of an integrated system that is working together properly.

To execute an installation, the user need merely perform the following steps:

1. Ensure that all files in the target system have a good backup.

2. Completed the pre installation steps and know the answers to the questions you will be asked by the cloning scripts.

3. Log in to the target machine as root.

4. Execute setup.sh.

5. Answer the questions properly for the target's specific environment

As previously mentioned, the iPrototype Storefront Cloning scripts perform a complete install by essentially copying an existing Storefront that has been fully integrated and is fully functional onto your machine. The initial iPrototype Storefront system integrating the various components is first installed and tested at a source installation. A copy of the necessary files for cloning this source installation is contained in the tar files from the installation media. The cloning scripts themselves are written and tested in at the source installation.

The task of Acopying@ a storefront to another machine is by no means a simple copy of source prototype's files from one machine to another. There are numerous files which contain site specific information which will not function properly in a new environment. The task of Acloning@ must therefore not only make a copy of all files, it must then reconfigure the appropriate files to contain the proper information for the new environment.

The deployment method is illustrated in Fig. 2 of the drawings. A main script file calls a series of application specific script files as illustrated at 201. Each subscript or set of subscripts performs the installation of a particular application module and issues prompts to the installer

indicating needed configuration data values and option choices as illustrated at 205 and accepts the values provided in response as indicate at 207.

This reconfiguration is achieved using a set of template files, which are reconfigured for the new environment. This set of template files consist of every file for all applications which contain any site specific configuration information. The template file is almost but not quite an exact copy of the original file from which it is based. Any site specific information has been replaced with a predefined string. This predefined string can be identified and located by the cloning scripts, which will then replace this string with a new value which is the actual value specific for the new machine hosting the new storefront site. These new values are derived from questions answered by the installer when he or she runs the setup script and are posted as illustrated at 209 in Fig. 2. There are dozens of files which must be edited and reconfigured, which means there are dozens of questions posed in the initial setup phase. The content of each of these template files is listed in the Appendix.

In addition to templates files, there are SQL scripts which must run to update information in the database to complete the reconfiguration. Proper execution of the iPrototype cloning scripts should result in a working storefront. The storefront and supporting server applications should be working and should include the applications selected when executing the cloning scripts.

Conclusion

It is to be understood that the methods and apparatus that have been described are merely illustrative applications of the principles of the present invention. Numerous modifications may be made by those skilled in the art without departing from the true spirit and scope of the invention.

What is claimed is:

1   1. An integrated online sales system which comprises, in combination,

2   a web database server connected to the Internet for storing product, customer and sales

3 transaction data, and

4   means for installing and managing the integrated operation of a cooperating set of

5 separate application program modules comprising:

6   a storefront application which executes on said web database server,

7   a content management application for creating and updating product data stored on said

8 database server,

9   a recommendation system for analyzing said customer and sales transaction data for

10 predicting the preferences of individual customers and making specific real-time

11 recommendations during a shopping session,

12   an advertising management application for selectively presenting advertising to each

13 customers during a shopping session, and

14   a reporting system for analyzing said sales transaction data to generate reports.

1   2. An integrated online sales system as set forth in claim 1 wherein said means for

2 installing and managing the integrated operation of said application program modules includes

3 pre-written operating system scripts for rapidly deploying said sales system onto one or more

4 target computers by automatically issuing prompts and accepting data values during the course of

5 the installation of said application program modules to modify said integrated system in

6 accordance with the needs of an individual installation.

1   3. An integrated online sales system as set forth in clam 2 wherein said means for

2 installing comprises a set of template configuration files and wherein said scripts when executed

3 issue prompts and accept data for modifying the content of said template configuration files in

4 accordance with the needs of an individual installation.

1   4. An integrated online sales system as set forth in claim 1 wherein said means for

2   installing and managing the integrated operation of said application program modules includes an

3   administration system that provides a Web interface for permitting authorized users to perform

4   centralized system administration functions.

1   5. The integrated online sales system as set forth in claim 4 wherein said administration

2   system performs a password protected log-in procedure to permit only authorized persons to

3   perform administration functions.

1   6. A method for rapidly deploying an integrated online sales system for performing online

2   sales transactions which comprises, in combination, the steps of:

3   providing a web database server connected to the Internet for storing product, customer

4   and sales transaction data in database tables, and

5   providing an integrated set of one or more pre-written operating system installation

6   scripts to perform the steps of:

7   installing a storefront application for execution on said web database server,

8   installing a content management application for creating and updating product data stored

9   in said database tables,

10   installing a profiling application for accumulating customer profile data describing the

11   activity of individual customers during shopping sessions,

12   installing a recommendation application for analyzing said customer profile data and said

13   sales transaction data to predicting the preferences of individual customers and for making

14   specific real-time recommendation to customers during a shopping session,

15   installing an advertising management application for selectively presenting advertising to

16   each customers during a shopping session, and

17   installing a reporting application for analyzing said sales transaction data to generate

18   reports.

1   7. The method as set forth in claim 6 wherein said pre-written operating system scripts

2   automatically perform the steps of issuing prompts and accepting data values during the course of

3   the installation of said application program modules to modify the operation of applications in

4   accordance with the needs of an individual installation.

1   8. The method as set forth in clam 7 wherein each of said applications accesses a

2   configuration file and wherein the steps of issuing prompts and accepting data modify the content

3   of each of said configuration files in accordance with the needs of an individual installation.

1   9. The method as set forth in claim 7 further comprising the steps of installing an

2   administration application and employing said administration application to present a centralized

3   menu system to an authorized user for performing centralized system administration functions.

        10. The method as set forth in claim 9 wherein said administration system performs a

password protected log-in procedure to permit only authorized persons to perform said

centralized administration functions using said centralized menu system.

Abstract of the Disclosure

A rapidly deployable, integrated online sales system consisting of a core storefront application that executes on a conventional web database server, a guided buying and sales configuration module for selling complex custom products and services, a content management module, a recommendation system for predicting the preferences of individual customers and making specific real-time recommendations during a shopping session, an advertising management system, a profiling system for customizing customer interactions based on the site visitor's demonstrated interests, and a reporting system that provides accurate and reliable analysis of user' behavior to create the valuable reports. The various components of the desired system are preferably first assembled as a pre-integrated prototype system on a source computer that can be rapidly recreated using pre-written operating system installation scripts which execute during the deployment process, prompting the installer to provide data values used to modify the content of pre-written configuration template files to accommodate the special needs of each individual installation. A web-based user interface provides centralized system administration which include content management, content workflow, user management, product management, the creation of advertising programs, and the design and invocation of analytical reporting functions.

DECLARATION FOR UTILITY OR DESIGN PATENT APPLICATION (37 CFR 1.63)	Attorney Docket Number	A-004
	First Named Inventor	Fadel, Tarek
	COMPLETE IF KNOWN	
	Application Number	/
	Filing Date	
☒ Declaration Submitted with Initial Filing OR ☐ Declaration Submitted after Initial Filing (surcharge (37 CFR 1.16 (e)) required)	Group Art Unit	
	Examiner Name	

As a below named inventor, I hereby declare that:

My residence, post office address, and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

> ## Methods and Apparatus for Implementing Internet Storefronts to Provide Integrated Functions

the specification of which   *(Title of the Invention)*

☒   is attached hereto
OR
☐   was filed on (MM/DD/YYYY) [＿＿＿＿＿＿] as United States Application Number or PCT International

Application Number [＿＿＿＿＿＿] and was amended on (MM/DD/YYYY) [＿＿＿＿＿＿] (if applicable).

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment specifically referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in 37 CFR 1.56.

I hereby claim foreign priority benefits under 35 U.S.C. 119(a)-(d) or 365(b) of any foreign application(s) for patent or inventor's certificate, or 365(a) of any PCT international application which designated at least one country other than the United States of America, listed below and have also identified below, by checking the box, any foreign application for patent or inventor's certificate, or of any PCT international application having a filing date before that of the application on which priority is claimed.

Table of Contents

```ksh
#!/bin/ksh
# Filename:  setup.sh
# Author:   Robert Wessa
# Parameters:     None
#
# Description:     This file will prompt the user for the necessary input
#           parameters to run the iPrototype installation.
#
#           This file will prompt you for directory, port number,
#           username, etc., information.  Please note the following two key
#           items.
#
#           Install type: (Full, DB only, iStore/OAS/iMarketing only,
#           Vignette only).
#           The installation has the ability to load everything on one
#           server or split it into a multitier architecture, consisting
#           of a database tier, application server/iStore/iMarketing tier,
#           and a Vignette tier.
#
#           iStore, OAS and iMarketing must be on the same server. They
#           can be included with the database on one central server or
#           loaded separately onto a middle tier applications server.
#
#           If the install type is
#           Full:    all products will be installed
```

```
#              DB Only: only the database (database files and software) will
#                      be loaded onto the current machine.
#              Application server: iStore, OAS, and iMarkting are installed
#                      on the current machine.
#              Vignette only: only the Vignette and Apache piece will be
#              installed.  Vignette requires the Apache server and does not
#              work with OAS currently.
#
#              If you do not choose a full install, you must install each
#              of the other options separately.
#
#              Vignette Inclusion:  Vignette can be included or dropped
#              from the solution set.
#
#              If the solution includes Vignette
#                  iStore templates which call Vignette will be copied.
#              If the solution does not include Vignette
#                  iStore templates which do not call Vignette will be copied.
#                  The Vignette schema will be removed from the database.
#                  The Vignette files will be removed from the file system
#                  The Apache files will be removed from the file system.
#                  Apache and Vignette references will be removed from the
#                      startup scripts.
#
#              After prompting for the required information, other variables
#              will be defined based on the values just received.

# Filename: setLinks_db.sh
#
# Author:    Robert Wessa
#            Northeast eBusiness Center
#            Oracle Corporation
#
# Description:
#
# This script calls the appropriate scripts to recreate the appropriate links
# within the Oracle directory structure for iPrototype to work after cloning.
# The cloning process will change the directory structure and
# and links must be recreated to match.
#
# Do not call this script directly.  It should be called form the main
# setup.sh script.

```

```ksh
#!/bin/ksh
# Filename:   setup.sh
# Author:     Robert Wessa
# Parameters:       None
#
# Description:      This file will prompt the user for the necessary input
#                   parameters to run the iPrototype installation.
#
#                   This file will prompt you for directory, port number,
#                   username, etc., information and the following two key
#                   items.
#
#                   Install type: (Full, DB only, iStore/OAS/iMarketing only).
#                   The installation has the ability to load everything on one
#                   server or split it into a database and application server.
#
#                   iStore, OAS and iMarketing must be on the same server. They
#                   can be included with the database on one central server or
#                   loaded separately onto a middle tier applications server.
#
#                   If the install type is
#                   Full:    all products will be installed
#                   DB Only: only the database (database files and software) will
#                            be loaded onto the current machine.
#                   Application server: iStore, OAS, and iMarkting are installed
#                            on the current machine.
#
#                   If you do not choose a full install, you must install each
#                   of the other two options separately.
#
#                   Vignette Inclusion:  Vignette can be included or dropped
#                   from the solution set.
#
#                   If the solution includes Vignette
#                       iStore templates which call Vignette will be copied.
#                   If the solution does not include Vignette
#                       iStore templates which do not call Vignette will be copied.
#                       The Vignette schema will be removed from the database.
#                       The Vignette files will be removed from the file system
#                       The Apache files will be removed from the file system.
#                       Apache and Vignette references will be removed from the
#                          startup scripts.

# Filename: reconfigureVignette.sh
#
# Author:    Robert Wessa
#            Northeast eBusiness Center
#            Oracle Corporation
#
# Description:
#
# This script reconfigures Vignette as part of the cloning process
# It must start up CMS, update the CAS entries, and remove the old
# ones which are invalid and remove the old directories.  The new
# CAS directory should have been created during the cloning process
# removes and recreates the appropriate links
#
# Usage:
#
# This script has to run as root and should not be called directly.
# The setup.sh procedure executed at cloning will eventually call this
# if the Vignette option has been chosen.
#

#
# Filename: setNet_db.sh
# Author:   rwessa
#           Oracle Corporation
# Description:
#              This file will create the tnsnames.ora and listener.ora file
#              needed in the network admin directory for the $ORACLE_HOME
#              for the database.
#              We no longer use links to create the OAS ORACLE_HOME version,
#              since they may now be on separate machines.
#              Instead, create two identical files based on the same
#              template, with separate create scripts for each.  There is a
#              corresponding setNet_i.sh script to create the tnsnames and
#              listener files for OAS.

/*
**  mod_%NAME%.c -- Apache sample %NAME% module
**  [Autogenerated via ``apxs -n %NAME% -g'']
**
**  To play with this sample module first compile it into a
**  DSO file and install it into Apache's libexec directory
```

```
**  by running:
**
**     $ apxs -c -i mod_%NAME%.c
**
**  Then activate it in Apache's httpd.conf file for instance
**  for the URL /%NAME% in as follows:
**
**     #   httpd.conf
**     LoadModule %NAME%_module libexec/mod_%NAME%.so
**     <Location /%NAME%>
**     SetHandler %NAME%
**     </Location>
**
**  Then after restarting Apache via
**
**     $ apachectl restart
**
**  you immediately can request the URL /%NAME and watch for the
**  output of this module. This can be achieved for instance via:
**
**     $ lynx -mime_header http://localhost/%NAME%
**
**  The output should be similar to the following one:
**
**     HTTP/1.1 200 OK
**     Date: Tue, 31 Mar 1998 14:42:22 GMT
**     Server: Apache/1.3b6-dev
**     Connection: close
**     Content-Type: text/html

# access.conf: Global access configuration
# Online docs at http://www.apache.org/

# This file defines server settings which affect which types of services
# are allowed, and in what circumstances.

# Each directory to which Apache has access, can be configured with respect
# to which services and features are allowed and/or disabled in that
# directory (and its subdirectories).

# Originally by Rob McCool

# First, we configure the "default" to be a very restrictive set of
# permissions.

<Directory />
Options FollowSymLinks
AllowOverride None
</Directory>

# Note that from this point forward you must specifically allow
# particular features to be enabled - so if something's not working as
# you might expect, make sure that you have specifically enabled it
# below.

# This should be changed to whatever you set DocumentRoot to.

#<Directory "O_R_A_C_L_E_A_P_B_A_S_E/htdocs">
<Directory "O_R_A_C_L_E_V_G_N_B_A_S_E/cas-docs">

# This may also be "None", "All", or any combination of "Indexes",
# "Includes", "FollowSymLinks", "ExecCGI", or "MultiViews".

# Note that "MultiViews" must be named *explicitly* --- "Options All"
# doesn't give it to you.

#Options Indexes FollowSymLinks

# ********** VIGNETTE ADDITIONS **********

/*
**   mod_%NAME%.c -- Apache sample %NAME% module
**   [Autogenerated via ``apxs -n %NAME% -g'']
**
**   To play with this sample module first compile it into a
**   DSO file and install it into Apache's libexec directory
**   by running:
**
**       $ apxs -c -i mod_%NAME%.c
**
**   Then activate it in Apache's httpd.conf file for instance
**   for the URL /%NAME% in as follows:
**
**       #   httpd.conf
**       LoadModule %NAME%_module libexec/mod_%NAME%.so
**       <Location /%NAME%>
**       SetHandler %NAME%
**       </Location>
**
**   Then after restarting Apache via
**
**       $ apachectl restart
**
**   you immediately can request the URL /%NAME and watch for the
**   output of this module. This can be achieved for instance via:
**
**       $ lynx -mime_header http://localhost/%NAME%
**
**   The output should be similar to the following one:
**
**       HTTP/1.1 200 OK
**       Date: Tue, 31 Mar 1998 14:42:22 GMT
**       Server: Apache/1.3b6-dev
**       Connection: close
**       Content-Type: text/html
**

# The location of the access logfile (Common Logfile Format).
# If this does not start with /, ServerRoot is prepended to it.

CustomLog logs/access_log common

# If you would like to have an agent and referer logfile uncomment the
# following directives.

#CustomLog logs/referer_log referer
#CustomLog logs/agent_log agent

# If you prefer a single logfile with access, agent and referer information
# (Combined Logfile Format) you can use the following directive.

#CustomLog logs/access_log combined

# PidFile: The file the server should log its pid to
PidFile logs/httpd.pid

# ScoreBoardFile: File used to store internal server process information.
# Not all architectures require this.  But if yours does (you'll know because
# this file is created when you run Apache) then you *must* ensure that
# no two invocations of Apache share the same scoreboard file.
ScoreBoardFile logs/apache_runtime_status

# The LockFile directive sets the path to the lockfile used when Apache
# is compiled with either USE_FCNTL_SERIALIZED_ACCEPT or
# USE_FLOCK_SERIALIZED_ACCEPT. This directive should normally be left at
# its default value. The main reason for changing it is if the logs
# directory is NFS mounted, since the lockfile MUST BE STORED ON A LOCAL
# DISK. The PID of the main server process is automatically appended to
# the filename.
#
#LockFile logs/accept.lock

# ExtendedStatus controls whether Apache will generate "full" status
# information (ExtendedStatus On) or just basic information (ExtendedStatus
# Off) when the server-status Handler is called. The default is Off.
#
#ExtendedStatus On

# ServerName allows you to set a host name which is sent back to clients for
# your server if it's different than the one the program would get (i.e. use
# "www" instead of the host's real name).
#
# Note: You cannot just invent host names and hope they work. The name you
# define here must be a valid DNS name for your host. If you don't understand
```

```
# this, ask your network administrator.
# If your host doesn't have a registered DNS name, enter its IP address here.
# You will have to access it by its address (e.g., http://123.45.67.89)
# anyway, and this will make redirections work in a sensible way.

#ServerName new.host.name

# Optionally add a line containing the server version and virtual host
# name to server-generated pages (error documents, ftp directory listings,
# mod_status and mod_info output etc., but not SSI generated documents).
# Set to "EMail" to also include a mailto: link to the ServerAdmin.
# Set to one of:  On | Off | EMail
ServerSignature on

# UseCanonicalName:  (new for 1.3)  With this setting turned on, whenever
# Apache needs to construct a self-referencing URL (a url that refers back
# to the server the response is coming from) it will use ServerName and
# Port to form a "canonical" name.  With this setting off, Apache will
# use the hostname:port that the client supplied, when possible.  This
# also affects SERVER_NAME and SERVER_PORT in CGIs.
UseCanonicalName on

# CacheNegotiatedDocs: By default, Apache sends Pragma: no-cache with each
# document that was negotiated on the basis of content. This asks proxy
# servers not to cache the document. Uncommenting the following line disables
# this behavior, and proxies will be allowed to cache the documents.

#CacheNegotiatedDocs

# Timeout: The number of seconds before receives and sends time out

Timeout 300

# KeepAlive: Whether or not to allow persistent connections (more than
# one request per connection). Set to "Off" to deactivate.

KeepAlive On

# MaxKeepAliveRequests: The maximum number of requests to allow
# during a persistent connection. Set to 0 to allow an unlimited amount.
# We reccomend you leave this number high, for maximum performance.

MaxKeepAliveRequests 100

# KeepAliveTimeout: Number of seconds to wait for the next request

KeepAliveTimeout 15

# Server-pool size regulation.  Rather than making you guess how many
# server processes you need, Apache dynamically adapts to the load it
# sees --- that is, it tries to maintain enough server processes to
# handle the current load, plus a few spare servers to handle transient
# load spikes (e.g., multiple simultaneous requests from a single
# Netscape browser).

# It does this by periodically checking how many servers are waiting
# for a request.  If there are fewer than MinSpareServers, it creates
# a new spare.  If there are more than MaxSpareServers, some of the
# spares die off.  These values are probably OK for most sites ---
```

```
MinSpareServers 5
MaxSpareServers 10

# Number of servers to start --- should be a reasonable ballpark figure.

StartServers 5

# Limit on total number of servers running, i.e., limit on the number
# of clients who can simultaneously connect --- if this limit is ever
# reached, clients will be LOCKED OUT, so it should NOT BE SET TOO LOW.
# It is intended mainly as a brake to keep a runaway server from taking
# Unix with it as it spirals down...

MaxClients 150

# MaxRequestsPerChild: the number of requests each child process is
#   allowed to process before the child dies.
#   The child will exit so as to avoid problems after prolonged use when
#   Apache (and maybe the libraries it uses) leak.  On most systems, this
#   isn't really needed, but a few (such as Solaris) do have notable leaks
#   in the libraries.

MaxRequestsPerChild 30

# Proxy Server directives. Uncomment the following line to
# enable the proxy server:

#ProxyRequests On

# Enable/disable the handling of HTTP/1.1 "Via:" headers.
# ("Full" adds the server version; "Block" removes all outgoing Via: headers)
# Set to one of: Off | On | Full | Block
#ProxyVia on

# To enable the cache as well, edit and uncomment the following lines:
# (no cacheing without CacheRoot)

#CacheRoot @@ServerRoot@@/proxy

#CacheSize 5
#CacheGcInterval 4
#CacheMaxExpire 24
#CacheLastModifiedFactor 0.1
#CacheDefaultExpire 1

AddLanguage de .de
AddLanguage da .da
AddLanguage el .el
AddLanguage it .it

# LanguagePriority allows you to give precedence to some languages
# in case of a tie during content negotiation.
# Just list the languages in decreasing order of preference.

LanguagePriority en fr de

# Redirect allows you to tell clients about documents which used to exist in
# your server's namespace, but do not anymore. This allows you to tell the
# clients where to look for the relocated document.
# Format: Redirect fakename url

# Aliases: Add here as many aliases as you need (with no limit). The format is
```

```
# Alias fakename realname

# Note that if you include a trailing / on fakename then the server will
# require it to be present in the URL.  So "/icons" isn't aliased in this
# example.

Alias /icons/ "O_R_A_C_L_E_A_P_B_A_S_E/icons/"

# ScriptAlias: This controls which directories contain server scripts.
# Format: ScriptAlias fakename realname

#ScriptAlias /cgi-bin/ "O_R_A_C_L_E_A_P_B_A_S_E/cgi-bin/"

# If you want to use server side includes, or CGI outside
# ScriptAliased directories, uncomment the following lines.

# AddType allows you to tweak mime.types without actually editing it, or to
# make certain files to be certain types.
# Format: AddType type/subtype ext1

# For example, the PHP3 module (not part of the Apache distribution)
# will typically use:
#AddType application/x-httpd-php3 .phtml
#AddType application/x-httpd-php3-source .phps

# AddHandler allows you to map certain file extensions to "handlers",
# actions unrelated to filetype. These can be either built into the server
# or added with the Action command (see below)
# Format: AddHandler action-name ext1

# To use CGI scripts:
#AddHandler cgi-script .cgi

# To use server-parsed HTML files
#AddType text/html .shtml
#AddHandler server-parsed .shtml

# Uncomment the following line to enable Apache's send-asis HTTP file
# feature
#AddHandler send-as-is asis

# If you wish to use server-parsed imagemap files, use
#AddHandler imap-file map

# To enable type maps, you might want to use
#AddHandler type-map var

# Action lets you define media types that will execute a script whenever
# a matching file is called. This eliminates the need for repeated URL
# pathnames for oft-used CGI file processors.
# Format: Action media/type /cgi-script/location
# Format: Action handler-name /cgi-script/location

# MetaDir: specifies the name of the directory in which Apache can find
# meta information files. These files contain additional HTTP headers
# to include when sending the document

#MetaDir .web
```

```
# MetaSuffix: specifies the file name suffix for the file containing the
# meta information.

#MetaSuffix .meta

# Customizable error response (Apache style)
#  these come in three flavors
#

# ExtendedStatus controls whether Apache will generate "full" status
# information (ExtendedStatus On) or just basic information (ExtendedStatus
# Off) when the server-status Handler is called. The default is Off.
#
#ExtendedStatus On

# ServerName allows you to set a host name which is sent back to clients for
# your server if it's different than the one the program would get (i.e. use
# "www" instead of the host's real name).
#
# Note: You cannot just invent host names and hope they work. The name you
# define here must be a valid DNS name for your host. If you don't understand
# this, ask your network administrator.
# If your host doesn't have a registered DNS name, enter its IP address here.
# You will have to access it by its address (e.g., http://123.45.67.89)
# anyway, and this will make redirections work in a sensible way.

#ServerName new.host.name

# Optionally add a line containing the server version and virtual host
# name to server-generated pages (error documents, ftp directory listings,
# mod_status and mod_info output etc., but not SSI generated documents).
# Set to "EMail" to also include a mailto: link to the ServerAdmin.
# Set to one of:  On | Off | EMail
ServerSignature on

# UseCanonicalName:  (new for 1.3)  With this setting turned on, whenever
# Apache needs to construct a self-referencing URL (a url that refers back
# to the server the response is coming from) it will use ServerName and
# Port to form a "canonical" name.  With this setting off, Apache will
# use the hostname:port that the client supplied, when possible.  This
# also affects SERVER_NAME and SERVER_PORT in CGIs.
UseCanonicalName on

# CacheNegotiatedDocs: By default, Apache sends Pragma: no-cache with each
# document that was negotiated on the basis of content. This asks proxy
# servers not to cache the document. Uncommenting the following line disables
# this behavior, and proxies will be allowed to cache the documents.

#CacheNegotiatedDocs
```

```
# Timeout: The number of seconds before receives and sends time out

Timeout 300

# KeepAlive: Whether or not to allow persistent connections (more than
# one request per connection). Set to "Off" to deactivate.

KeepAlive On

# MaxKeepAliveRequests: The maximum number of requests to allow
# during a persistent connection. Set to 0 to allow an unlimited amount.
# We reccomend you leave this number high, for maximum performance.

MaxKeepAliveRequests 100

# KeepAliveTimeout: Number of seconds to wait for the next request

KeepAliveTimeout 15

# Server-pool size regulation.  Rather than making you guess how many
# server processes you need, Apache dynamically adapts to the load it
# sees --- that is, it tries to maintain enough server processes to
# handle the current load, plus a few spare servers to handle transient
# load spikes (e.g., multiple simultaneous requests from a single
# Netscape browser).

# It does this by periodically checking how many servers are waiting
# for a request.  If there are fewer than MinSpareServers, it creates
# a new spare.  If there are more than MaxSpareServers, some of the
# spares die off.  These values are probably OK for most sites ---

MinSpareServers 5
MaxSpareServers 10

# Number of servers to start --- should be a reasonable ballpark figure.

StartServers 5

# Limit on total number of servers running, i.e., limit on the number
# of clients who can simultaneously connect --- if this limit is ever
# reached, clients will be LOCKED OUT, so it should NOT BE SET TOO LOW.
# It is intended mainly as a brake to keep a runaway server from taking
# Unix with it as it spirals down...

MaxClients 150

# MaxRequestsPerChild: the number of requests each child process is
#  allowed to process before the child dies.
#  The child will exit so as to avoid problems after prolonged use when
#  Apache (and maybe the libraries it uses) leak.  On most systems, this
#  isn't really needed, but a few (such as Solaris) do have notable leaks
#  in the libraries.

MaxRequestsPerChild 30

# Proxy Server directives. Uncomment the following line to
# enable the proxy server:

#ProxyRequests On
```

```
# Enable/disable the handling of HTTP/1.1 "Via:" headers.
# ("Full" adds the server version; "Block" removes all outgoing Via: headers)
# Set to one of: Off | On | Full | Block
#ProxyVia on

# To enable the cache as well, edit and uncomment the following lines:
# (no cacheing without CacheRoot)

#CacheRoot @@ServerRoot@@/proxy

#CacheSize 5
#CacheGcInterval 4
#CacheMaxExpire 24
#CacheLastModifiedFactor 0.1
#CacheDefaultExpire 1
#NoCache a_domain.com another_domain.edu joes.garage_sale.com

# Listen: Allows you to bind Apache to specific IP addresses and/or
# ports, in addition to the default. See also the VirtualHost command

#Listen 3000
#Listen 12.34.56.78:80

# VirtualHost: Allows the daemon to respond to requests for more than one
# server address, if your server machine is configured to accept IP packets
# for multiple addresses. This can be accomplished with the ifconfig
# alias flag, or through kernel patches like VIF.

# Any httpd.conf or srm.conf directive may go into a VirtualHost command.
# See also the BindAddress entry.

#<VirtualHost host.some_domain.com>
#ServerAdmin webmaster@host.some_domain.com

# AddDescription allows you to place a short description after a file in
# server-generated indexes.
# Format: AddDescription "description" filename

# ReadmeName is the name of the README file the server will look for by
# default. Format: ReadmeName name
#
# The server will first look for name.html, include it if found, and it will
# then look for name and include it as plaintext if found.
#
# HeaderName is the name of a file which should be prepended to
# directory indexes.

ReadmeName README
HeaderName HEADER

# IndexIgnore is a set of filenames which directory indexing should ignore
# Format: IndexIgnore name1 name2...

IndexIgnore .??* *~ *# HEADER* README* RCS

# AccessFileName: The name of the file to look for in each directory
# for access control information.

AccessFileName .htaccess

# The following lines prevent .htaccess files from being viewed by
# Web clients.  Since .htaccess files often contain authorization
# information, access is disallowed for security reasons.  Comment
# these lines out if you want Web visitors to see the contents of
# .htaccess files.  If you change the AccessFileName directive above,
# be sure to make the corresponding changes here.

<Files .htaccess>
order allow,deny
deny from all
</Files>

# TypesConfig describes where the mime.types file (or equivalent) is
# to be found.

TypesConfig conf/mime.types

# DefaultType is the default MIME type for documents which the server
# cannot find the type of from filename extensions.

DefaultType text/plain

# AddEncoding allows you to have certain browsers (Mosaic/X 2.1+) uncompress
# information on the fly. Note: Not all browsers support this.
```

```
AddEncoding x-compress Z
AddEncoding x-gzip gz

# AddLanguage allows you to specify the language of a document. You can
# then use content negotiation to give a browser a file in a language
# it can understand.  Note that the suffix does not have to be the same
# as the language keyword --- those with documents in Polish (whose
# net-standard language code is pl) may wish to use "AddLanguage pl .po"
# to avoid the ambiguity with the common suffix for perl scripts.

AddLanguage en .en
AddLanguage fr .fr
AddLanguage de .de
AddLanguage da .da
AddLanguage el .el
AddLanguage it .it

# LanguagePriority allows you to give precedence to some languages
# in case of a tie during content negotiation.
# Just list the languages in decreasing order of preference.

LanguagePriority en fr de

# Redirect allows you to tell clients about documents which used to exist in
# your server's namespace, but do not anymore. This allows you to tell the
# clients where to look for the relocated document.
# Format: Redirect fakename url

# Aliases: Add here as many aliases as you need (with no limit). The format is
# Alias fakename realname

# Note that if you include a trailing / on fakename then the server will
# require it to be present in the URL.  So "/icons" isn't aliased in this
# example.

Alias /icons/ "O_R_A_C_L_E_A_P_B_A_S_E/icons/"

# ScriptAlias: This controls which directories contain server scripts.
# Format: ScriptAlias fakename realname

#ScriptAlias /cgi-bin/ "O_R_A_C_L_E_A_P_B_A_S_E/cgi-bin/"

# If you want to use server side includes, or CGI outside
# ScriptAliased directories, uncomment the following lines.

# AddType allows you to tweak mime.types without actually editing it, or to
# make certain files to be certain types.
# Format: AddType type/subtype ext1

# For example, the PHP3 module (not part of the Apache distribution)
# will typically use:
#AddType application/x-httpd-php3 .phtml
#AddType application/x-httpd-php3-source .phps

# AddHandler allows you to map certain file extensions to "handlers",
# actions unrelated to filetype. These can be either built into the server
# or added with the Action command (see below)
# Format: AddHandler action-name ext1
```

```
# To use CGI scripts:
#AddHandler cgi-script .cgi

# To use server-parsed HTML files
#AddType text/html .shtml
#AddHandler server-parsed .shtml

# Uncomment the following line to enable Apache's send-asis HTTP file
# feature
#AddHandler send-as-is asis

# If you wish to use server-parsed imagemap files, use
#AddHandler imap-file map

# To enable type maps, you might want to use
#AddHandler type-map var

# Action lets you define media types that will execute a script whenever
# a matching file is called. This eliminates the need for repeated URL
# pathnames for oft-used CGI file processors.
# Format: Action media/type /cgi-script/location
# Format: Action handler-name /cgi-script/location

# MetaDir: specifies the name of the directory in which Apache can find
# meta information files. These files contain additional HTTP headers
# to include when sending the document

#MetaDir .web

# MetaSuffix: specifies the file name suffix for the file containing the
# meta information.

#MetaSuffix .meta

# Customizable error response (Apache style)
#   these come in three flavors
#
#      1) plain text
#ErrorDocument 500 "The server made a boo boo.
#   n.b.  the (") marks it as text, it does not get output
#
#      2) local redirects
#ErrorDocument 404 /missing.html
#   to redirect to local url /missing.html
#ErrorDocument 404 /cgi-bin/missing_handler.pl
#   n.b. can redirect to a script or a document using server-side-includes.
#
#      3) external redirects
#ErrorDocument 402 http://some.other_server.com/subscription_info.html
#

# mod_mime_magic allows the server to use various hints from the file itself
# to determine its type.
#MimeMagicFile conf/magic

# The following directives disable keepalives and HTTP header flushes.
# The first directive disables it for Netscape 2.x and browsers which
# spoof it. There are known problems with these.
# The second directive is for Microsoft Internet Explorer 4.0b2
```

```

; iPayment 3.1.0 Integration Parameters
; -------------------------------------
;=============================================================
;| If you want to use HTTPS ( or SSL ) to communicate with
;| the iStore customer for iPaymentPay page which lets the
;| customer input the Credit Card Number, you should set
;| using_ssl as true. But you should set up a SSL port
```

```
;| manually through OAS Node Manager by yourself
;=================================================================
;using_ssl= false
;=================================================================
;| If you set using_ssl as true and you already set up a
;| SSL port manually through OAS Node Manager, you will
;| set ssl_host_name as that fully qualified OAS machine
;| name, Ex: a.b.com
;=================================================================
;ssl_host_name= [full qualified machine name]
;=================================================================
;| If you set using_ssl as true and you already set up a
;| SSL port manually through OAS Node Manager, you will
;| set ssl_port as the port number you set up for cstage
;| listener using SSL under OAS Node Manager
;=================================================================
;ssl_port= [ssl port number you already set up in OAS]
;=================================================================
;| If you set using_ssl as true and you already set up a
;| SSL port manually through OAS Node Manager, you should
;| also set this host_name as that fully qualified OAS
;| machine name which non-ssl port is running, Ex: a.b.com
;=================================================================
;host_name= [full qualified machine name]
;=================================================================
;| If you set using_ssl as true and you already set up a
;| SSL port manually through OAS Node Manager, you should
;| also set this host_port as the port number you set up
;| for cstage listener not using SSL under OAS Node Manager
;=================================================================
;host_port= [non-ssl port number you set up in OAS]
;=================================================================
;| If you want to use HTTPS ( or SSL ) to communicate
;| between the iStore Server and iPayment Server, you
;| should set this ipayment_using_ssl as true ( the default
;| is false ). For making this work, you should follow the
;| OAS Administration Manual and iPayment Manual to config
;| both OAS running iStore and OAS running iPayment
;| correctly. And you should set up the followed two
;| parameters.
;=================================================================
ipayment_using_ssl = false
;=================================================================
;| If you set the ipayment_using_ssl as true, you need set
;| this ipayment_oas_wallet_loc as the directory you put
;| the oracle wallet for SSL certification, you should follow
;| the OAS Administration Manual and iPayment Manual to config
;| both OAS running iStore and OAS running iPayment correctly.
;=================================================================
;ipayment_oas_wallet_loc = [directory you put oracle wallet]
;=================================================================
;| If you set the ipayment_using_ssl as true, you need set
;| this ipayment_oas_wallet_pass as the password you use to
;| access your oracle wallet, you should follow the OAS
;| Administration Manual and iPayment Manual to config both
;| OAS running iStore and OAS running iPayment correctly.
;=================================================================
;ipayment_oas_wallet_pass = [ password used to access your oracle wallet]
```

rollback_segments           = (rb01,rb02,rb03,rb04)

###########################################################################
# Example INIT.ORA file
#
# This file is provided by Oracle Corporation to help you customize
# your RDBMS installation for your site.  Important system parameters
# are discussed, and example settings given.
#
# Some parameter settings are generic to any size installation.
# For parameters that require different values in different size
# installations, three scenarios have been provided: SMALL, MEDIUM
# and LARGE.  Any parameter that needs to be tuned according to
# installation size will have three settings, each one commented
# according to installation size.
#
# Use the following table to approximate the SGA size needed for the
# three scenarious provided in this file:
#
#                   -------Installation/Database Size------
#                   SMALL           MEDIUM          LARGE
#  Block       2K   4500K           6800K           17000K
#  Size        4K   5500K           8800K           21000K
#
# To set up a database that multiple instances will be using, place
# all instance-specific parameters in one file, and then have all
# of these files point to a master file using the IFILE command.
# This way, when you change a public
# parameter, it will automatically change on all instances.  This is
# necessary, since all instances must run with the same value for many
# parameters. For example, if you choose to use private rollback segments,
# these must be specified in different files, but since all gc_*
# parameters must be the same on all instances, they should be in one file.
#
# INSTRUCTIONS: Edit this file and the other INIT files it calls for
# your site, either by using the values provided here or by providing
# your own.  Then place an IFILE= line into each instance-specific
# INIT file that points at this file.

# The Profile Marker Log file.  Profile marker information can be
# recorded in pmark.log.  The Date, Time, VisitorId, URI, Category, and
# Keyword  of every page view containing Profile Markers can be
# recorded.
#
# The following *PMARK* variables govern the ways in which information
# can be recorded.  A facility is provided so that logs can be
# automatically accumulated by month.   Each month a new pmark.log file
# will be created named pmark.log.nn where nn represents the month.
# Alternatively the traditional StoryServer MAX_LOG_SIZE rollover to
# .bak mechanism is also provided. Due to the potential size of this
# file(s), this logging is turned off by default,
# i.e., PZN_PMARK_LOG_MAX is set to 0.  To enable Profile Marker
# logging, set PZN_PMARK_LOG_MAX to either -1 for unlimited size (in
# which case you should use the SUFFIX mechanism) or some reasonable
# maximum size.

# The file to record Profile Marker information.
# This file name is also affected by HTTPD_LOG_BY_PID. If HTTPD_LOG_BY_PID is set
# to 1, the process id is appended to this filename.

Appendix I - User and Group Names

This section provides a summary listing of all usernames and groups ports used by the iPrototype on the UNIX.

We recommend that you should the same UNIX group for all users. Typically, this ends up being the group "dba". You may use "dba" even if that exists on your system already. If you are concerned users in the "dba" group should not be able to read files related to the iPrototype Storefront, set the privileges accordingly, or choose another group.

Each application is owned by a different user. We recommend that each username selected include the ORACLE_SID as part of its name. On large system with many users, this helps organize the usernames so that it is easy to identify their purpose.

We recommend that you choose new usernames that do not yet exist on your UNIX system. The cloning process will create the user directory and place a ".profile" file and other files in the home directory for the user. Choosing a username that exists could result in files for that user being overwritten.

The following table shows some typical choices for usernames. These choices were made assuming you have chosen and ORACLE_SID=ipr1

Username	applications owned
ipr1ora	Oracle database files and code
ipr1ics	All OAS and iStore code
ipr1sp	Selling Point*
ipr1vg	All Vignette related code
ipr1ap	All Apache related code
ipr1np	All Net Perceptions related code
ipr1eg	All Engage Ad Manager code

* Note that Selling Point templates for iStore are in the iStore templates directory and would be owned by ipr1ics.

Appendix II - Port Usage

This section provides a summary listing of all ports used by the iPrototype on the UNIX server. There are approximately 20 ports required by the iPrototype, depending on the configuration chosen. Note that when the cloning scripts are executed, you are prompted for a base port number which will be used as a starting sequence for all ports numbers. This helps system administrators better keep track of the ports in use on their machines. All ports used by the iPrototype storefront will be in a consecutive range of numbers from 01 to about 40, prefixed with the base port number. Note that not every number in that range is used. The base port number entered serves as a prefix for all port numbers used. The selected base port number will be followed by a 2 digit number which needs to specifically identify a port number to be used on the UNIX system. For example, if you answer 245, then all ports will start with 245, to be followed with two more digits. The result is that you will use ports 24501, 24502, ..., up to approximately 24537.

Port Number (prefixed by base port)	Component Application	Purpose
_01	Apache/Vignette	Apache Listener for Vignette CAS
_05	Apache/Vignette	Apache Listener for Vignette
_06	Apache/Vignette	Apache Listener for Vignette CMD
_07	Apache/Vignette	Apache Listener for Vignette CTLD
_08	Apache/Vignette	Apache Listener for Vignette TMD
_09	Apache/Vignette	Apache Listener for Vignette PAD
_10	Apache/Vignette	Apache Listener for Vignette PM (CMS)
_11	OAS	www Port
_12	OAS	Node Manager Port
_14	OAS	ORB Port
_18	OAS	admin Port
_20	OAS	mstage Port
_21	OAS	cstage Port
_22	OAS	cdeploy Port
_23	OAS	ots Port
_36	Vignette	VHS Port
_37	Oracle	TNS DB Listener

Appendix III Base Port Number Restrictions

This section describes restrictions on selecting a base port number. Due to certain UNIX conventions, and also to methods used by some of the various software applications, ports set to certain numbers will not work, or will require special attention in order to make them work properly. For these reasons, we recommend that you do not use certain numbers.

You may select a zero to three digit number as the base port number. Note that UNIX requires that any port number under a certain number requires root access to start the application which uses that number. Some of the applications have a maximum port number value above which they will not work. Therefore, there are certain minimum and maximum base port numbers which are recommended.

The cutoff point requiring root access on UNIX system is 1024. If you choose, 10 as the base port number, then you would require root access to start all applications. This is because you would end up using ports 1001, 1002, ... etc., which are under the 1024 cutoff point. For this reason, we generally recommend that you choose a number greater than or equal to 11 for the base port number.

Note that Vignette requires that you start it from root. It is the only application which requires root access. All other applications can be started from a non privileged account.

Vignette has a maximum port number requirement. You should not go over 32000. Therefore you should not exceed 320 as the maximum base port number.

The recommended value for the base port number is in the range 11..320.

Making your iPrototype Storefront the default application for your machine

Note that you may want your storefront to be the default application served when a web browser makes a request to your server. For example, you want to be able to request http://www.myserver.com and receive the home page of the storefront, instead of having to include a port number and making a request like http://www.myserver.com:24501. This can be done easily although it is not supported as an automatic feature of the scripts.

The default port number is 80 for any request to a server which does not include a port number. This means that http://www.myserver.com is essentially a request to http://www.myserver.com:80. In the iPrototype Storefront configuration, to make your server send the storefront when no port number is included, you must set the cstage listener defined in OAS listen on port 80. This implies you can't already have another application responding to port 80. You must make this change after the installation is completed.

- Edit the cstage.cfg file

- Change the port number reference to use the value of 80

- Stop and restart OAS (using the stop and start procedures in the iprlics user from the example)

If you reconfigure your store to use another listener, that listener must be set to listen on port 80.

Appendix IV Required Setup Information

The following table contains all the information requested by the setup script. The first choice is to determine the type of setup to be performed. In most cases, you will want to choose option F to perform the complete setup. You have the option of selecting the individual components one at a time if you would like to place one of them on a different server, or vary the standard setup associated with a complete installation.

Columns designed with a value of TBD will have values that are subject to change and therefore could not be defined in this document. A default value will exist when you actually run the script, and the value provided will be appropriate for each release. In most cases, this value should not be changed. The production release of the cloning scripts may hide these prompts.

Setup Prompt	Default Value	Value Options	Description
Please specify 1 of the 4 installation types to be performed	F	V, I, D, F, X	F = install the complete solution V = install Vignette and Apache only I = install iStore, OAS, and iMarketing only D = install database only X = exit setup without performing any actions
Will Vignette be part of the solution set (Y or N) [Y]	y	Y, N	Y = install Vignette N = do not install Vignette This question is only needed if you choose to perform a full install, but you are not including Vignette in the solution set
Would you like to see debugging information	N	Y,N	Y = include extended debugging info in the installation log files N = include standard debugging info in the installation log files
Enter the installation home directory	current directory		directory where setup.sh is located. If have set your directory to where the setup.sh is located, it is automatically determined for you
Enter the base user directory	/users	any valid directory (existing or one that could be created)	Location under which the home directory for the users will be created. The home directories will be created if they don't already exist (recommended). You would typically choose an existing directory under which user home directories exist and you would choose new usernames which result in new directories created under the existing /users directory, .e.g, /users/ipr1ora
Enter the base applications directory	[/u01/app]	any valid directory (existing or one that could be created)	Directories will be created if they don't exist (recommended). The names will be the same as the username chosen to own each application, e.g., /u01/app/ipr1ora

Enter the old hostname	TBD	Do not change	Since this method is a clone of a working storefront built in Oracle's eBusiness Center, the installation needs to know the previous machine name so that it can be updated on your new machine. You must accept the default value.
Enter the old ORACLE_SID	TBD	Do not change	Since this method is a clone of a working storefront built in Oracle's eBusiness Center, the installation needs to know the previous ORACLE_SID name so that it can be updated on your new machine. You must accept the default value.
Enter the old Apache Base number	TBD	Do not change	Since this method is a clone of a working storefront built in Oracle's eBusiness Center, the installation needs to know the previous Apache base number so that it can be updated on your new machine. You must accept the default value.
Enter the Oracle OS username	ipr1ora	any valid username	Please refer to the Appendix section on User and Group names
Enter the Apache OS username	ipr1ap	any valid username	Please refer to the Appendix section on User and Group names
Enter the iStore OS username	ipr1ics	any valid username	Please refer to the Appendix section on User and Group names
Enter the Net Perceptions OS username	ipr1np	any valid username	Please refer to the Appendix section on User and Group names
Enter the Vignette OS username	ipr1vg	any valid username	Please refer to the Appendix section on User and Group names
Enter the old Vignette CAS Port	TBD	Do not change	Since this method is a clone of a working storefront built in Oracle's eBusiness Center, the installation needs to know the previous Apache base number so that it can be updated on your new machine. You must accept the default value.
Enter the old Vignette base directory	TBD	Do not change	Since this method is a clone of a working storefront built in Oracle's eBusiness Center, the installation needs to know the previous Apache base number so that it can be updated on your new machine. You must accept the default value.
Enter the new Group name for these users	dba	any valid groupname	Please refer to the Appendix section on User and Group names
Enter the new ORACLE_SID	ipr1	any valid SID	ORACLE_SID is the system identifier which uniquely identifies the database
Enter the location for your ORACLE_BASE	based on base applications directory	any valid directory	You should generally accept the default value based on the base applications directory you entered earlier. It will automatically assume /bd/username where bd is the base directory from above and username is the username

			owning the application
Enter the location for your ORACLE_HOME	ORACLE_B ASE/produ ct/805	Do not change	You must accept the default location. This is a fixed value once you determine the ORACLE_BASE location
Enter the location for your ORACLE_OAS_B ASE	based on base applications directory	any valid directory	You should generally accept the default value based on the base applications directory you entered earlier. It will automatically assume /bd/username where bd is the base directory from above and username is the username owning the iStore and OAS application
Enter the location for your ORACLE_OAS_P ROD_BASE	ORACLE_B ASE/produ ct/OAS4081	Do not change	You must accept the default location. This is a fixed value once you determine the ORACLE_OAS_BASE location
Enter your new OAS_SITE_NAME	ORACLE_SI D	Any valid site name	This is the site name for OAS. This can be changed, but it is recommended that you use the default value of the ORACLE_SID
Enter your old OAS_SITE_NAME	TBD	Do not change	Since this method is a clone of a working storefront built in Oracle's eBusiness Center, the installation needs to know the previous Apache base number so that it can be updated on your new machine. You must accept the default value.
Enter the location for your Vignette base directory	based on base applications directory	any valid directory	You should generally accept the default value based on the base applications directory you entered earlier. It will automatically assume /bd/username where bd is the base directory from above and username is the username owning the iStore and OAS application
Enter the location for your Apache base directory	based on base applications directory	any valid directory	You should generally accept the default value based on the base applications directory you entered earlier. It will automatically assume /bd/username where bd is the base directory from above and username is the username owning the iStore and OAS application
Enter the Apache Ports Base	245	up to a 3 digit number*	Please refer to the Appendix section on Base Port numbers
Enter the location for your Net Perceptions base directory	based on base applications directory	any valid directory	You should generally accept the default value based on the base applications directory you entered earlier. It will automatically assume /bd/username where bd is the base directory from above and username is the username owning the Net Perceptions application
Enter the new Net Perceptions port	24535	valid port number	You should accept the default value
Enter the parent Oracle database file directory	/u01/orada ta	any valid directory (existing or one that could be created)	Directories will be created if they don't exist (recommended). The names will be the same as the username chosen to own each application, e.g., /u01/app/ipr1ora
Enter the base Oracle database	based on the parent	any valid directory	You should generally accept the default value based on the parent Oracle directory you entered earlier. It will automatically assume

file directory	Oracle directory	directory	entered earlier. It will automatically assume /pd/SID where pd is the parent Oracle directory from above and SID is the ORACLE_SID from above
Enter the database server hostname if different	current server	valid server name	This is required if you plan on using a multitier approach and you are installing the iStore/OAS/iMarketing option on the middle tier. You must supply the database server name
Enter the new domain	TBD	any valid domain name	You should enter your domain, or the domain where the server will reside, typically "company.com"
Enter the new proxy server	TBD	the machine and domain name of the proxy server	You must supply the correct proxy server name and domain for you environment, e.g., proxy.company.com
Enter the new proxy port	80	proper port number	Enter the proper port number for you proxy server
Enter the OAS Ports Base	245	up to a 3 digit numer	Refer to the Appendix section on Base Port number
Enter the directory location containing the TAR files	TBD	existing directory where tar file are located	This is the directory where the tar files are located, either on CD, in which case it is already known, or on disk, where you would have to specify where you placed the files
Enter the directory in which to place startup scripts	TBD	enter a valid directory	Valid directory where you want to place your startup scripts. If you do not use the standard UNIX directory, you must copy this script to that locatoin so that the application starts up automatically at boot time
Enter the directory to write installation log files	/tmp	enter a valid directory	Valid directory where you want to place your installation log files.
Enter the summary file name	summary.log	any valid filename	enter a filename for the summary log file
Enter the installation log file name	install.log	any valid filename	enter a filename for the log file

Appendix V Shell Script Reference

This section gives an overview of the iPrototype Cloning scripts. They actually consist of a number of individual scripts performing various functions. It is not necessary to completely understand what each script does. You may execute the scripts without having read this section, but must be familiar with all other parts of this document before performing the installation.

The following table explains the main shell scripts which comprise the cloning scripts. Note that in many cases, for each application, there is a separate version of each script performing lower level functions. For example, to create users, there is a createUsers.sh script referenced. There are actually about five scripts for creating users. In the interest of brevity, the table shall list one script for each purpose. A name followed by the symbol "*" indicates there are multiple versions of this file.

As mentioned above, there is only one script which must be executed, and all other sripts will be called by that script, or a script which was called by the initial script. The initial script is called setup.sh.

The purpose of setup.sh is to prompt you for all the required information in order to clone the iPrototype Storefront and then to call the appropriate supporting scripts to perform actual installation.

Note that you must be logged in as root in order to execute the cloning scripts.

Script Name	Called By	Purpose
setup.sh	executed by you	This is the first and only script you must execute. It takes no parameters, prompts you for all required information, and calls the appropriate scripts to perform the desired installation
main.sh	setup.sh	Verifies certain information and calls the appropriate installation script
check_access.sh	main.sh	Checks for proper privileges by verifying you are logged in as root
check_sid.sh	main.sh	Verifies we are not using the same ORACLE_SID as the old one
check_setup.sh	main.sh	Displays the value of all parameters storing the answer to the setup questions
install.sh*	main.sh	Main installation procedure (separate version for each installation option)
unTar.sh*	install.sh*	Untars the appropriate tar file (separate version for each installation option)
setLinks.sh	install.sh*	Define proper UNIX directory and file links
createUsers.sh*	install.sh*	Create the appropriate user (separate version for each installation option)

setOwners.sh*	install.sh*	Sets the ownership of files just untarred to the username just created
setInit.sh	install.sh*	Creates the startup and stop scripts for starting and stopping the applications
configureApache. sh	install.sh*	Configure the Apache files for the new server
configureVignette .sh	install.sh*	Configure the Vignette files for the new server
updateNetp.sh	install.sh*	Updates Net Perceptions database
reconfigureVigne tte.sh	install.sh*	ReConfigures the new Vignette CAS on the new server. The database and Vignette must be up and running for this step
configureOAS.sh	install.sh*	Configures the OAS files for the new machine
setNet.sh*	install.sh*	Creates the proper TNSNAMES and LISTENER files
configureNetp.sh	install.sh*	Configures the Net Perceptions files for the new machine
configureICS.sh	install.sh*	Configures the iStore files for the new machine
setOratab.sh	install.sh*	Create the necessary oratab entry
configureDB.sh	install.sh*	Configures the Oracle database files
